### **DEFINITIONS**

- NA Novel agent, e.g., cBTKi or BCL2i
- **NASeq** Novel agent sequence
  - o cBTKi → BCL2i
  - o BCL2i → cBTKi
- **TTNMD** Time to next mechanism of therapy or death

### **BACKGROUND**

- NAs, including covalent Bruton tyrosine kinase inhibitors (cBTKi) and B-cell lymphoma 2 inhibitors (BCL2i) as monotherapies or in combination with anti-CD20 monoclonal antibodies (CD20mAb), are effective for the treatment of chronic lymphocytic leukemia (CLL) in both the frontline (1L) and relapsed/refractory (R/R) settings.
- Sequential single NA-based therapies allow for durable disease control in many patients with CLL, though whether cBTKi followed by BCL2i (cBTKi → BCL2i) or BCL2i followed by cBTKi (BCL2i → cBTKi) leads to a longer duration of disease control remains unknown.

## **METHODS**

Single-center retrospective study

#### **Inclusion Criteria:**

- Received care at Mayo Clinic for CLL between 1/1/2012 and 4/1/2025
- Received sequential single NA-based therapies: cBTKi and BCL2i (+/- CD20mAB)
  - o Administered first NA in 1L or R/R setting

#### **Exclusion Criteria:**

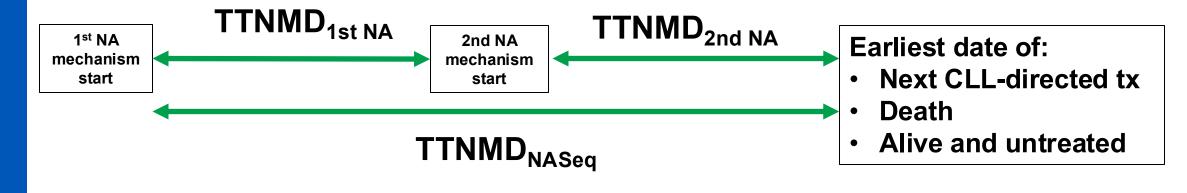

- Received a CLL-directed NA prior to NASeq
- Treated with at least one of the NAs in NASeg for Richter transformation
- Received any other CLL-directed therapy between the NAs in the sequence

#### **Data Collection:**

- Clinical and disease characteristics at first NA initiation
- Prior treatment history
- Duration of each single NA therapy and reasons for therapy discontinuation
- For patients who discontinued therapy due to intolerance or completion of planned therapy and subsequently received treatment within the same class of NA:
- Entire duration of treatment with NA with the same mechansims and treatment-free observation were included in TTNMTD
- Allowed for capturing the entire duration of disease control from each NA mechanism

### **Statistical Approach:**

- Kaplan-Meier method used to estimate TTNMD and overall survival (OS)
- Multivariable Cox models used for outcome analysis with results reported as hazard ratios (HR) and 95% confidence intervals (95% CI)

### PRIMARY OBJECTIVE

Compare TTNMD<sub>NASeq</sub> between cBTKi → BCL2i and BCL2i -> cBTKi to determine which treatment sequence allowed for more durable disease control.

BCL2i → cBTKi cBTKi → BCL2i

# **RESULTS**

TABLE: Characteristics at Initiation of First NA in Sequence

	BCLZI 7 CB I KI	(N=149)	
	(N=19)		
	N with data	N with data	
	n (%)	n (%)	p value
Age at treatment initiation,		64.3	0.051
median [range]	[37.0 – 85.6]	[39.5 – 85.9]	
Sex	19	149	0.663
Female	6 (32)	40 (27)	
Male	13 (68)	109 (73)	
Rai Stage	14	112	0.712
0	2 (14)	15 (13)	
1 / 11	4 (29)	48 (43)	
III / IV	8 (57)	49 (44)	
IGHV Mutation Status	14	110	0.260
Mutated	4 (29)	18 (16)	
Unmutated	10 (71)	92 (84)	
FISH Results	13	95	0.478
Del(13q)	1 (8)	29 (31)	
Tri(12)	2 (15)	12 (13)	
Del(11q)	3 (23)	16 (17)	
Del(17p)	5 (39)	25 (26)	
Other	1 (8)	2 (2)	
Normal	1 (8)	11 (12)	
Complex Karyotype	6	20	0.105
No S	2 (33)	14 (70)	
Yes	4 (67)	6 (30)	
TP53 Aberrant	15	108	0.599
No	10 (67)	79 (73)

Prior chemotherapy	19	149	0.370
No	11 (58)	70 (47)	
Yes	8 (42)	79 (53)	

### FIGURE 1: TTNMD for A. First NA in the sequence; B. Second NA in the sequence

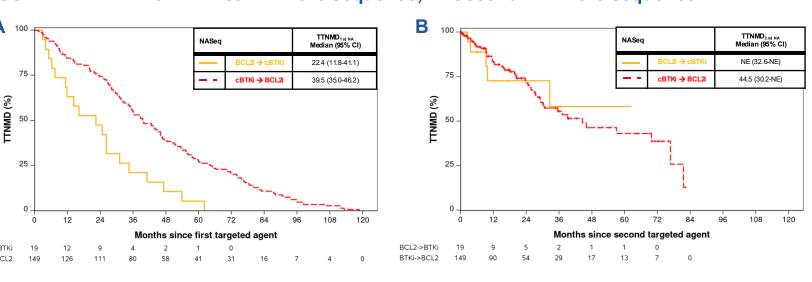

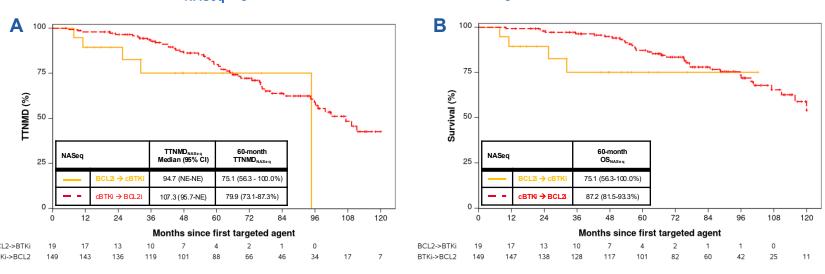

FIGURE 2: A. TTNMD<sub>NASeq</sub> by cohort; B. Overall survival by cohort

- There was no significant difference in TTNMD<sub>NASeq</sub> for patients treated with cBTKi → BCL2i vs BCL2i → cBTKi (HR 1.61, 95% CI 0.54, 4.81) after adjusting for TP53 aberration, prior chemoimmunotherapy exposure, and age.
- TP53 aberration was associated with inferior TTNMD<sub>NASeq</sub>, regardless of NA treatment sequence (HR 3.15, 95% CI 1.64, 6.08).

### **CONCLUSIONS**

- For patients who received sequential NA, either cBTKi → BCL2i or BCL2i -> cBTKi, the overall duration of disease control achieved with these two classes was not significantly different.
- Future multicenter collaborations may allow for more power to observe differences between these NA sequences.
- These data support <u>basing treatment decisions on patient</u> preference and comorbidities for patients with CLL when selecting between cBTKi and BCL2i as the first NA-based therapy.
